KNOW WHEN TO WATER

SO THERE'S ENOUGH FOR EVERYONE

FREQUENTLY ASKED QUESTIONS ABOUT THE Chicot Aquifer

Where is the Chicot Aquifer?

The Chicot Aquifer is located under all or parts of 15 parishes in southwestern Louisiana and parts of east Texas.

How much water is used daily?

Recent data from the United States Geological Survey
(USGS) indicates that more than 800 million gallons of water are withdrawn from the aquifer on an average day.

Who uses the aquifer?

The aquifer is the source of drinking water for virtually every person living in southwest Louisiana. It also serves as the primary water supply for most commercial, industrial, institutional, and agricultural uses.

WHERE DOES YOUR WATER COME FROM?

The Lafayette Utilities System (LUS) water source is the Chicot Aquifer, a large, natural underground "lake" in southwest Louisiana. It is a stable and plentiful fresh water supply. Once water reaches the plants, it is cleaned through a three-stage process that includes (1) softening, (2) filtering, and (3) disinfecting before it reaches your tap.

As part of the Source Water Assessment Program (SWAP), the Louisiana Department of Environmental Quality conducted an assessment of LUS's water sources. The purpose of that assessment was to determine what sources, if any, are vulnerable to contamination from surface sources. The program considers well age and construction, location of the well in relation to potential sources of contamination, and actual test data. According to the report, the LUS water system had a susceptibility rating of "medium." This analysis is used in comparison with other water systems in the state to establish priorities and protection activities. LUS's SWAP report is available for review by contacting Craig Gautreaux, Water/Wastewater Operations Manager, at 337.291.5921.

OUR COMMITMENT TO YOU

Producing an average of 22 million gallons per day, Lafayette Utilities System (LUS) has provided safe, clean drinking water for more than 100 years. We have always strived to plan and execute leading strategies and technologies to bring our customers quality drinking water.

LUS goes beyond simply complying with regulations. We take extra steps to ensure that all water delivered to you is safe, good tasting, clean, and meets our highest standards. LUS has planned carefully to provide continuous water service during emergencies. Although not every contingency can be anticipated, we have prepared well to ensure the water utility's survival. We recognize that with a continuous water supply during emergencies, critical services such as fire suppression and public health can be maintained.

This Water Quality Report is a mandate of the Environmental Protection Agency, in compliance with the 1996 amended Safe Drinking Water Act, which requires all community water systems to deliver a brief annual water quality report. This report includes required language that is not suggestive of a problem for LUS customers. We believe this is a great tool for educating and communicating with our customers. As you read through this report, if you need additional information or would like something clarified, please call Craig Gautreaux, Water/Wastewater Operations Manager, at 337.291.5921.

The Lafayette Public Utilities Authority, the group of elected officials who oversee all of LUS operations, meets at 4:30 PM on the first and third Tuesday of every month at City Hall located at 705 W. University Avenue.

WATER QUALITY REPORT

No Violations Occurred in the Calendar Year of 2017

Monitored Before Any Treatment

Substance	Major Source in Drinking Water	EPA Designated Contaminant Level	EPA Designated Max Contaminant Level Goal	LUS Max	LUS Range
Arsenic	Erosion of natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes	10 ppb	0 ppb	1.0 ppb	0-1.0 ppb
Fluoride	Erosion of natural deposits; Discharge from fertilizer and aluminum factories	4 ppm	4 ppm	0.2 ppm	0.2 ppm
Nitrate-Nitrite	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits	10 ppm	10 ppm	0.037 ppm	0.0-0.037 ppm
Combined Radium (-226 & -228)	Erosion of natural deposits	5 pCi/L	0 pCi/L	2.71 pCi/L	0.809-2.71 pCi/L
Gross Alpha Particle Activity	Erosion of natural deposits	15 pCi/L	0 pCi/L	4.56 pCi/L	0-4.56 pCi/L
Gross Beta Particle Activity	Decay of natural and man-made deposits. Note: The gross beta particle activity MCL is 4 millirems/year annual dose equivalent to the total body or any internal organ. 50 PCi/L is used as a screening level.	50 pCi/L	0 pCi/L	2.13 pCi/L	0-2.13 pCi/L

Monitored At Customer's Tap

Substance	Major Source in Drinking Water	EPA Designated Action Level (requires treatment) at 90th Percentile	Range	Sites over Action Level	LUS Results at 90th Percentile Testing
Lead	Corrosion of household plumbing systems; Erosion of natural deposits	15 ppb	1–44	2	2 ppb or less

The results from 2016 sampled triennially.

Lead has not been detected in LUS's source water, nor does LUS have any lead pipes in its water distribution system.

What are contaminants anyway?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels through the ground, it dissolves naturally occurring minerals. In some cases, water can pick up substances resulting from the presence of animals or human activity, as well as radioactive materials. Contaminants that may be present in water before any treatment

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic

Inorganic contaminants, such as salts and metals, which can be naturally occurring or may result from urban storm water runoff, industrial or domestic wastewater discharges, oil or gas production, mining, or farming.

Organic contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and

In order to ensure tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water that must provide the same protection for public health.

Looking Ahead LUS is excited about this opportunity to reach our customers and is always staying abreast of new technologies to better serve you. We urge you to call us at 337.291.5921 or visit us online at lus.org if you have any questions concerning water quality.

information about contaminants and potential health effects can be obtained by calling the **Environmental Protection Agency's** Safe Drinking Water Hotline (800-426-4791). Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy. persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk for infections. These people should seek advice about drinking water from their health care providers. **FPA/Centers for Disease Control** and Prevention guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe. Drinking Water Hotline (800-426-4791). Fecal coliforms and E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal waste. Microbes in these wastes can cause short-term effects, such as diarrhea, cramps nausea, headaches or other symptoms. They may pose a special health risk for infants. young children, some of the elderly, and people with severely compromised immune systems. If present, elevated levels of lead can cause serious health problems especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing LAFAYETTE UTILITIES WATER SYSTEM is responsible for providing high-quality drinking water, but cannot control the variety of materials used in plumbing components. When vour water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead

Drinking water, including bottled

water, may reasonably be expected to contain at least small amounts of some contaminants. but their presence does not necessarily indicate that water poses a health risk. More
