WATER QUALITY REPORT 202

- 15.2X -

MCI G

0 pCi/L

Range

1.6 pCi/l

Our water quality system grade, as issued by the Louisiana Department of Health, is "A." Our water system report card can be found at: https://tinyurl.com/LDH-2022-Water-Grade.

No Violations Occurred in the 2022 Calendar Year

MONITORED BEFORE ANY TREATMENT

Substance	Major Source in Drinking Water	MCL	MCLG	LUS Max	LUS Range	
Arsenic Erosion of natural deposits; runoff from orchards; runoff from glass and electronics production wastes Barium Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits		10 ppb	0 ррb	1.6 ppb	< RL-1.6 ppb	
		2 ppm	2 ppm	0.26 ppm	< RL-0.26 ppm	
Fluoride	Erosion of natural deposits; water additive that promotes strong teeth; discharge from fertilizer and aluminum factories	4 ppm	4 ppm	0.2 ppm	0.2 ppm

WHAT ARE CONTAMINANTS ANYWAY?

gs, and wells. As water travels through the ground, it dissolves naturally occurring minerals. In some , water can pick up substances resulting from the presence of animal or human activity, as well as

MICROBIAL CONTAMINANTS, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

INORGANIC CONTAMINANTS, such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, oil or gas production, mining, or farming.

ORGANIC CONTAMINANTS, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems. PESTICIDES AND HERBICIDES, which may come from a variety of sources, such as agriculture, urban

stormwater runoff, and residential uses.

RADIOACTIVE CONTAMINANTS, which can be naturally occurring or be the result of oil and gas production and mining activities.

To ensure tap water is safe to drink, the EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water and must provide the same protection for public health.

LOOKING AHEAD LUS is excited about this opportunity to reach our customers and is always staying abreast of new technologies to better serve you. We urge you to call us at 337-291-5921 or visit us online at lus.org/contact-us if you have any questions concerning water quality.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants, but their presence does not necessarily indicate that water poses a health risk. More information about health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791). Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, system disorders, some elderly and infants, can be particularly at risk for infections. These people should seek advice about drinking water from their health care providers. EPA/ Centers for Disease Control and Prevention guidelines on appropriate means to on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791). If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water primarily occurs from materials and components associated with service lines and home plumbing. LAFAYETTE UTILITIES WATER SYSTEM is responsible for providing high-quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by running your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead

in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

DEFINITIONS

ACTION LEVEL (AL) The concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system must follow.

LOCATIONAL/RUNNING ANNUAL AVERAGE (LRAA/RAA) The average of testing results for the last four quarters at a specific location or system-wide.

MAXIMUM CONTAMINANT LEVEL (MCL)

allowed in drinking Gs as feasible, he highest level of a contaminant that is allow vater. MCLs are set as close to the MCLGs sing the best available treatment technology. MAXIMUM CONTAMINANT LEVEL GOAL (MCLG)

The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

MAXIMUM RESIDUAL DISINFECTION LEVEL GOAL (MRDLG) The amount of disinfectant in drinking water below which there is no known or expected health risk.

MAXIMUM RESIDUAL DISINFECTANT LEVEL (MRDL) The highest level of disinfectant allowed. EPA cites conv evidence of the need for disinfectant to control microbial contaminants.

PARTS PER BILLION (PPB) Equivalent to one minute in 2,000 years, or a single penny in

PARTS PER MILLION (PPM) Equivalent to one minute in two years or a single penny in

PICOCURIES PER LITER (PCI/L) A measure of radioactivity **REPORTING LIMIT (RL)** The lowest concentration of a chemical that can be reported by a laboratory.

KNOW WHEN TO WATER SO THERE'S ENOUGH FOR EVERYONE

The Water Conservation Ordinance is in effect UNTIL SEPTEMBER 30.

WHERE DOES YOUR WATER COME FROM?

The Lafayette Utilities System (LUS) water source is the Chicot Aquifer, a large, natural underground "lake" in Southwest Louisiana. It is a stable and plentiful freshwater supply. Once water reaches the plants, it is cleaned through a three-stage process that includes (1) softening, (2) filtering, and (3) disinfecting before it reaches your tap.

As part of the Source Water Assessment Program (SWAP), the Lou Environmental Quality conducted an assessment of LUS's water so assessment was to determine what sources, if any, are vulnerable to surface sources. The program considered well age and construction relation to potential sources of contamination, and actual test data. A the LUS water system had a susceptibility rating of "medium." This a comparison with other water systems in the state to establish prioriti activities. US's SWAP report is available for review by contaction C

ces. The purpose of the contamination from location of the well in cording to the report, alysis was used in a and protection

FREQUENTLY ASKED QUESTIONS ABOUT THE CHICOT AQUIFER

WHERE IS THE CHICOT AQUIFER? The Chicot Aquifer is located under all or parts of 15 parishes in Southwest Louisiana and parts of East Texas.

HOW MUCH WATER IS USED DAILY?

Recent data from the United States Geological Survey (USGS) indicates that more than 800 million gallons of water are withdrawn from the aquifer on an average day.

WHO USES THE AQUIFER?

The aquifer is the source of drinking water for virtually every person living in Southwest Louisiana. It also serves as the primary water supply for most commercial, industrial, institutional, and agricultural uses.

OUR COMMITMENT TO YOU

Producing an average of 22 million gallons per day, Lafayette Utilities System (LUS) has provided safe, clean drinking water for over 125 years. We have always strived to plan and execute leading strategies and technologies to bring our customers quality drinking water.

LUS goes beyond simply complying with regulations. We take extra steps to ensure that all water delivered to you is safe, good tasting, and clean, meeting our highest standards. LUS has planned carefully to provide continuous water service during emergencies. Although not every contingency can be anticipated, we have prepared well to ensure the water utility's survival. We recognize that with a continuous water supply during emergencies, critical services, such as fire suppression and public health, can be maintained.

This Water Quality Report is a mandate of the Environmental Protection Agency (EPA) in compliance with the 1996 amended Safe Drinking Water Act, which requires all community water systems to deliver a brief annual water quality report. This report includes required language that is not suggestive of a problem for LUS customers. We believe this is a great tool for educating and communicating with our customers. If you need additional information or would like something clarified, please call Craig Gautreaux, Water/Wastewater Operations Manager, at 337-291-5921.

The Lafayette City Council oversees all LUS operations and meets at 5:30 PM on the first and third Tuesday of each month at City Hall, located at 705 W. University Avenue.
